

Electromagnetic Flowmeter Type MAGNETOFLOW™ M1000

Description

ModMAG® M1000 is best suited for bidirectional flow measurements of fluids > 5 $\mu\text{S}/\text{cm}$ (> 20 $\mu\text{S}/\text{cm}$ for demineralized water). Thanks to its excellent price-performance ratio, ModMAG® M1000 can be chosen for a broad spectrum of applications.

All information like flow, total or error messages can be read-out from the backlit LCD display. The standard model is provided with a great number of inputs, outputs and interfaces for lots of applications. ModMAG® M1000 is encased in an aluminium housing with protection class IP67 and therefore also ideal for use in harsh environments.

Measuring principle

The operating principle of the electromagnetic flow meter is based on Faraday's law of magnetic induction: The voltage induced across any conductor, as it moves at right angles through a magnetic field, is proportional to the velocity of that conductor. The voltage induced within the fluid is measured by two diametrically opposed internally mounted electrodes. The induced signal voltage is proportional to the product of the magnetic flux density, the distance between the electrodes and the average flow velocity of the fluid.
